

Abstract of the Disclosure

A side brush for mounting on a body of a sweeping machine for use as a brush rotatable about a rotation axis. A plurality of individual bristle segments are detachably mountable to a base. Bristles included in the bristle segments are integrated for a solid unit with a frame member. The base includes a substantially planar disc assembly that is integrally provided with a coupling system for coupling the bristle segments therewith. The coupling system includes elongated channels disposed in the base in a substantially radial direction and extending through the base. The channels open all the way to the edge of the base and enable coupling the bristle segments immovably to the engagement with body of a sweeping machine with the base with fasteners interconnecting the same.
